

Crime Mapping

1. User Access (Entry Point)

What happens:

- User opens the website
- Can:
 - Register an account
 - Login to existing account

System process:

- PHP validates input
- Stores/retrieves user data from database
- Starts session

Output:

- User is redirected to their dashboard

2. User Dashboard (Main Control Panel)

What the user sees:

- Welcome message
- Quick summary:
 - Recent crime reports
 - Nearby incidents
 - Alerts and notifications
- Navigation menu

System process:

- PHP fetches user and crime data
- AJAX loads recent incidents dynamically

Output:

- Personalized dashboard with live updates

3. Submit Crime Report

What the user does:

- Select crime type (Theft, Robbery, Assault, Vandalism, etc.)
- Enter description

- Input location (barangay or coordinates)
- Set severity level (Low, Medium, High)
- Upload image or evidence (optional)
- Submit report

System process:

- AJAX sends data to PHP (no page reload)
- PHP validates and stores report
- Image/evidence is uploaded and linked

Output:

- Report is recorded
- Confirmation message displayed dynamically

4. View Crime Reports (Live Feed)

What the user does:

- Opens crime feed

System process:

- AJAX fetches reports periodically
- PHP retrieves latest crime data

Output:

- Auto-updating list of crime incidents

5. Filter and Search Reports

What the user does:

- Filters by:
 - o Crime type
 - o Severity
 - o Date
 - o Location

System process:

- AJAX sends filter request
- PHP processes query

Output:

- Filtered results displayed instantly

6. Report Status Tracking**What the user does:**

- Views submitted reports
- Checks status

System process:

- PHP retrieves status updates:
 - o Pending
 - o Under Investigation
 - o Action Taken
 - o Resolved

Output:

- User sees progress of report

7. Real-Time Crime Alerts**What happens:**

- High-severity crime is reported

System process:

- AJAX polling checks for new alerts
- PHP returns high-priority data

Output:

- Instant alert notification displayed
- Users are warned of nearby incidents

8. Crime Mapping Visualization (Core Feature)**What the user does:**

- Opens map view
- Views crime locations

System process:

- PHP provides location coordinates
- AJAX loads data into map interface
- (Optional) Map API used for visualization

Output:

- Map displays crime markers
- Clicking marker shows details

9. Community Validation / Confirmation**What the user does:**

- Confirms or supports a reported incident

System process:

- AJAX sends confirmation request
- PHP updates validation count

Output:

- Validation count updates dynamically

10. Admin Access (Police / Authority Panel)**What happens:**

- Admin logs in

System process:

- PHP validates admin credentials
- Starts session

Output:

- Admin dashboard is displayed

11. Admin Dashboard (Monitoring Panel)**What the admin sees:**

- Total crime reports
- Active cases

- Resolved cases
- High-risk areas

System process:

- PHP aggregates crime data
- AJAX updates dashboard dynamically

Output:

- Real-time monitoring interface

12. Review and Verify Reports

What the admin does:

- Reviews submitted reports
- Approves or rejects entries
- Adds remarks

System process:

- PHP updates report status
- Logs admin actions

Output:

- Reports are verified or dismissed

13. Case Management and Status Updates

What the admin does:

- Updates case progress
- Marks cases as resolved

System process:

- PHP updates database

Output:

- Users see updated case status

14. Crime Analytics and Reports

What the admin does:

- Opens analytics page

System process:

- PHP calculates:
 - o Crime frequency by type
 - o Most affected areas (hotspots)
 - o Time-based trends

Output:

- Data displayed in tables

15. Export Crime Data**What the admin does:**

- Downloads crime reports

System process:

- PHP generates CSV file

Output:

- Downloadable dataset

16. Notification System**What triggers notifications:**

- New crime report
- Status updates
- High-risk alerts

System process:

- PHP stores notifications
- AJAX retrieves updates

Output:

- Notifications displayed dynamically

17. Admin System Management**Admin can:**

- Manage users
- Manage crime categories

- Monitor reports
- Remove false or invalid reports

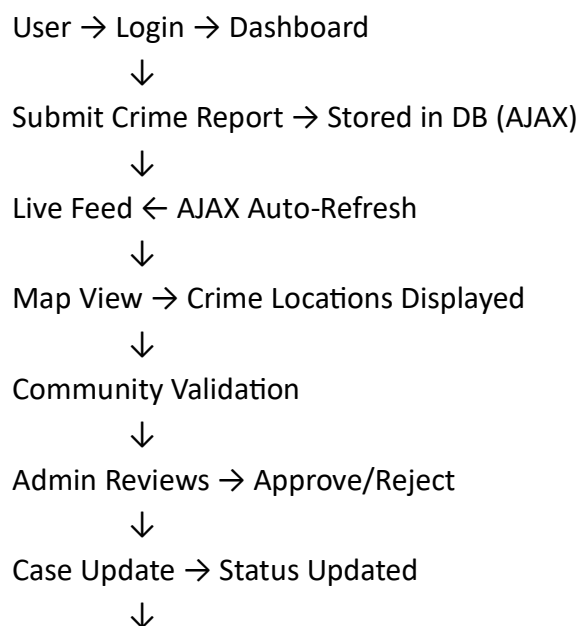

Output:

- System remains accurate and controlled

System Workflow

1. User registers and logs in
2. Submits crime report
3. Report is stored in database
4. Community validates report
5. Admin reviews and verifies
6. Admin updates case status
7. System triggers alerts (if high severity)
8. User views crime map and tracks updates
9. Admin analyzes crime trends
